

SECTOR PACKAGE · ENTERPRISE AND DATA CENTERS

Critical changes under control, operations that can be proven

Control, context and verifiable evidence for privileged access, sensitive changes and high-impact operations in IT and data centers.

An administrator changes a configuration in production. A vendor connects remotely. One API calls another. An automated script deploys. **Each one can produce real consequences**, and today's tools answer partial questions. *Who governs the complete action — from request to evidence — when something touches production?*

WHAT VELANTIA BRINGS TO THIS SEGMENT

GATE — decides each change and each privileged access: **allow, condition, time-limit, require a second approval or block**, based on policy and context.

SENTINEL — observes the behavior of administrators, services and vendors, **detects anomalies** and attributes each action to its actor.

EVIDENCE — preserves the **verifiable history of every change**: who requested it, who approved it, what was executed and with what outcome.

AUTONOMY — governs scripts, automations and AI agents operating on your systems, with **limits and human approval**.

WHAT YOU CAN DO WITH IT

- ▶ **Govern configuration changes and sensitive deployments** with policy, context and cumulative approvals.
- ▶ **Privileged access with real limits**: bounded time, reduced scope and dual approval where it applies.
- ▶ **External vendor access** bounded to the task, the time window and the system — and recorded end to end.
- ▶ **Change evidence ready for audit**: every critical operation with its coherent trail, without rebuilding scattered logs.

The same layer that controls the change **produces the evidence** the audit will ask for later.

DEPLOYMENT

Software, virtual machine, private cloud or Trust Appliance, with unified governance in **VELANTIA ONE**. For data centers and large deployments, the **CORE 900** appliance; for branches and offices, **EDGE 200** (both available for pre-order). It integrates with your identity, SIEM, XDR and cloud **without replacing the existing stack**.

WHY NOW

Non-human identities already outnumber human ones in most organizations, and every change without evidence is a future dispute. Regulators, customers and insurers are starting to **demand proof** of which control was applied to each critical operation. Whoever does not govern the change can only reconstruct it afterwards.

Next step: an initial meeting and a demonstration.

Full flow in a controlled environment: request → policy → approval or block → evidence. A scoped pilot proposal is available, with metrics and no deployment commitment.
